A perfect square always has an

odd number of odd factors. A perfect square always has even number

of even factors. The sum of all factors of a perfect square is always odd

but if the sum of all factors of a number is odd, we cannot say that it

must be a perfect square.

Perfect square : Quantitative Questions - GMAT Club

Why do perfect squares have a odd amount of factors

Why do perfect squares have a odd amount of factors

Therefore, the factors are 1, 2, 3, 4, 6, 9, 12, 18, and 36. Here, there is an odd number of factors because the square

root of the perfect square (in this case 6) does not have a pair. Therefore,

perfect squares have an odd number of factors because the square root of the perfect square does not have a pair.

Therefore, perfect squares have an odd number of factors

because the square root of the perfect square does not have a pair.

Therefore, perfect squares have an odd number of factors

because the square root of the perfect square does not have a pair.

Therefore, perfect squares have an odd number of factors

because the square root of the perfect square does not have a pair.

Therefore, perfect squares have an odd number of factors

because the square root of the perfect square does not have a pair.

Therefore, perfect squares have an odd number of factors

because the square root of the perfect square does not have a pair.
