The linear range can be measured simply by making a plot of analyte concentration versus fluorescence, using 0 , £ evenly-spaced analyte concentrations, and seeing at what concentration the data deviate from a straight line that is tangent to the 0 , £ low end of the concentration range.

Determining the linear range is relatively easy, and can be achieved by 0 , £

taking a sample and performing a serial dilution

. If the ranges overlap then determining the amount of sample to load 0 , £ is also similarly easy.
